

CALIBRATION PROCESS

Through our calibration service we achieve to remove the saw marks in our wood, and we replace them by a final sanding. With this process, we also let each piece at its standard size.

To obtain the best results, we calibrate our woods with a calibrator sander and not with cutters. This process it's always done before any other process like the assembling or the moulding.

The pieces are not calibrated at the final size needed to each instrument.

This process is not done in all the pieces, so the client must ask for (in the pieces which have the option of calibrating). If any client wants to personalize or custom his calibrating, you can contact us to know the different possibilities we can offer you.

Important note: Orders with this option can suffer variations regard to delivery times, since the wood in our stock is not calibrated.

If you need more information about the calibration process of our wood, don't hesitate in contact us. We will be pleased to answer you any question personally in our offices, through our telephone number (+34) 96 134 03 01 or via email:
